

ABSTRACT OF THE DISCLOSURE

A test assisting program and a test assisting method are effective in reducing the time and effort required to enter operation inputs in authenticating operation of a server application, and for obtaining highly reliable test results. When a structured document is outputted from a server computer, attribute information of a data input area is acquired, and candidate data depending on the attribute information is generated. A processing description for enabling a document browsing device to carry out a process of displaying the candidate data and a process of entering the candidate data selected by an operation input into the data input area, is inserted in a structured document. The structured document with the processing description inserted therein is transferred to the document browsing device. Then, the document browsing device displays the candidate data when it displays the structured document. When desired candidate data is selected by the operation input, the selected candidate data is set in the data input area.
